MS in Computer Science, 9+ years of experience in large-scale distributed systems, data engineering and full stack web development.

EMPLOYMENT

- Snowflake – Senior Software Development Engineer** | San Mateo, CA Sep 2021 – Present
- Automated wavefront alerts pipeline which reduced alert deployment time by 70 percent and enabled more frequent deployment.
 - Migrated Telegraf based legacy metrics system to more robust open-telemetry based metrics pipeline.
- Adobe – Senior Software Development Engineer** | San Jose, CA Aug 2017 - Sep 2021
- Designed and developed a data pipeline to consume and store operational metrics in Prometheus. Scaled the system incrementally to support a volume of over 27 billion datapoints per day.
 - Enabled users to migrate from enterprise New Relic monitoring to Prometheus thereby reducing the overall monitoring cost.
- NVIDIA – Software Intern** | Santa Clara, CA May 2016 - Dec 2016
- Worked on development of alert and monitoring pipeline using ELK Stack and AWS technologies.
 - Developed a logging utility to standardize logging and metric ingestion for customers thereby reducing the overall time of onboarding customers to our platform.
- Nalashaa Solutions - Senior Software Engineer** | Bangalore, India Aug 2014 - July 2015
- Worked on developing a reusable base framework which accelerated the team's development activities.
- Newgen Technologies - Senior Software Engineer** | Noida, India Dec 2013 - Aug 2014
- Implemented google analytics in the web application thereby helping to convert the prospects to subscribed customers.
- Computer Sciences Corporation – Software Engineer** | Noida, India Aug 2010 - April 2012
- Improved prescription workflow experience for health care providers by implementing a template based multi-purpose text editor.

RELEVANT SKILLS

- Programming: Java, Python, JavaScript, Typescript, Bash, Go
- Java Frameworks: Dropwizard, Spring MVC, Spring Boot, Spring AOP
- Data and Monitoring: Prometheus, OpenTSDB, Kafka, Akka-Streams, KStreams, CloudWatch, Wavefront
- Visualization and Logging: Grafana, New Relic, Splunk, Tableau, Kibana, Logstash, Log4J, Telegraf, OpenTelemetry
- Cloud and Deployment: Docker, S3, Lambda, EC2, SQS, Kubernetes, Terraform
- Databases: MySQL, MongoDB, DynamoDB, Elasticsearch, SQL Server
- Web Technologies: HTML, CSS, Bootstrap, jQuery, React, Redux, GraphQL
- Testing: JUnit, TestNG, Mockito, Wiremock, JMeter, Gatling
- Tools and IDEs: IntelliJ, PyCharm, Visual Studio, JIRA, Maven, Gradle, Jenkins, GitHub, Fiddler
- Support and On-call: PagerDuty, Exigence

EDUCATION

- The University of Texas at Arlington **MS Thesis in Data Engineering** **GPA: 3.88/4.0**
- Thesis Topic:** *Visual Logging Framework Using ELK Stack* is a near real time logging system built on top of Kafka and ELK stack. It enables real time log visualization without compromising the performance of parent application by utilizing producer consumer scheme.

RELEVANT PROJECTS

- Operational Metrics Monitoring and Alerting (Java, Dropwizard, Akka-Streams-Kafka, Prometheus, KStreams)**
- Built a data pipeline which enabled the teams to move from performance expensive Grafana based alerts to a Prometheus based alerting infrastructure thereby providing reliable and low-latency alerts.
 - Optimized storage of high cardinality metrics by implementing an aggregation system to reduce total number of datapoints.
- Customer Insights Service (Java, Dropwizard, Spring-Kafka, Spring Boot, OpenTSDB, KStreams)**
- Improved existing Rest API service to V2 enabling up to 300 concurrent request per second with a P99 under 2 second.
 - Provided support for group-by over metric dimensions and optimized large response payloads using pagination.
- Subscription Engine (Java, Spring Boot, Spring AOP, myBatis, Maven, Jackson, JavaScript, Spring AOP, XML, JSON)**
- Worked on micro services-based model to decompose a legacy system into micro services.
 - Built TestNg scripts using Mockito and Wiremock as part of test-driven development.
- Log Based Monitoring (Java, Python, Log4J, AWS S3, AWS Lambda, Jenkins, Elasticsearch, Kibana)**
- Developed a log monitoring framework on top of Elasticsearch, Log4J and Amazon S3, logging gigabytes of data every day.
 - Implemented an efficient design using producer-consumer pattern to scale the utility as per the growing needs.
- Scenario Modelled Testing (Java, Spring Boot Test, Wiremock, TestNg, Spring AOP, Jackson, JSON, Java Reflection API)**
- Developed an SDK to provide support for testing Rest APIs modelled as prerequisite and dependent scenarios thereby reducing the redundant code to generate test data as a pre-test step.
- Cricut.com (Java, Spring Boot, MySQL, Rest API, jQuery, KnockoutJs, Bootstrap, JSON, HTML, CSS, XML)**
- Built a single page application using client-side frameworks like jQuery, AngularJs and Spring Boot on the backend.
 - Used KnockoutJs for its efficient two-way binding functionality and implemented the client framework using MVVM.

ACHIEVEMENTS

- Received **Spot award at Adobe** for driving and automating migration of more than seventy services from a legacy monitoring system to a more efficient Prometheus based monitoring system.
